

ACI-THEIA

AUTOMATED COSMETIC INSPECTION

TECHNOLOGY PREVIEW

Satisloh's **ACI-Theia** brings automation to an entirely manual process step: Cosmetic Inspection. Based on its state-of-the-art vision system combined with smart algorithms and - ultimately - Artificial Intelligence (AI), it enables truly objective and reliable quality control and quality optimization

FEATURES + BENEFITS

- Detects every possible cosmetic defect on a lens: scratches, pits, smudges, fingerprints, surfacing marks.
- Based on the lab's cosmetic quality standards, the machine then decides if the lens passes or not.
- Lenses that ACI-Theia categorizes as "good" do not require further inspection. Only lenses categorized as "borderline" or "bad" are reviewed by an inspector.
- Labs will need fewer inspectors, which reduces labor cost as well as staffing and trainings needs.
- Labs define their own quality standards or use pre-defined ones and can standardize inspection criteria within one lab or across multiple locations.
- Objective data enables effective root cause analysis for fast trouble shooting of quality issues. Use MES-360 to analyze the link between lens history and defects.
- High throughput of over 300 lph makes ACI-Theia the ideal system for fully automated larger production facilities
- Robotic handling system is not touching the lens surface with a suction cup; 4-finger gripper touches only the lens edge => no scratches or marks
- Track, record and prove your adherence to quality standards, which is becoming increasingly critical with demanding customers and regulatory requirements.

DEFECTS DETECTION

Scratches
